## Views

### Unique visitors

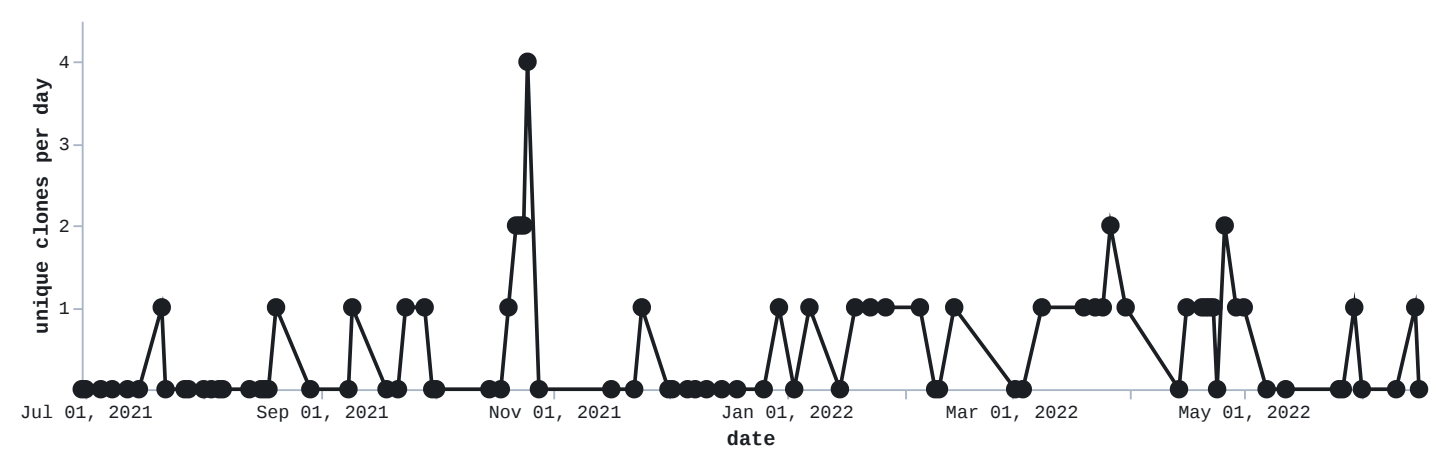

### Total views

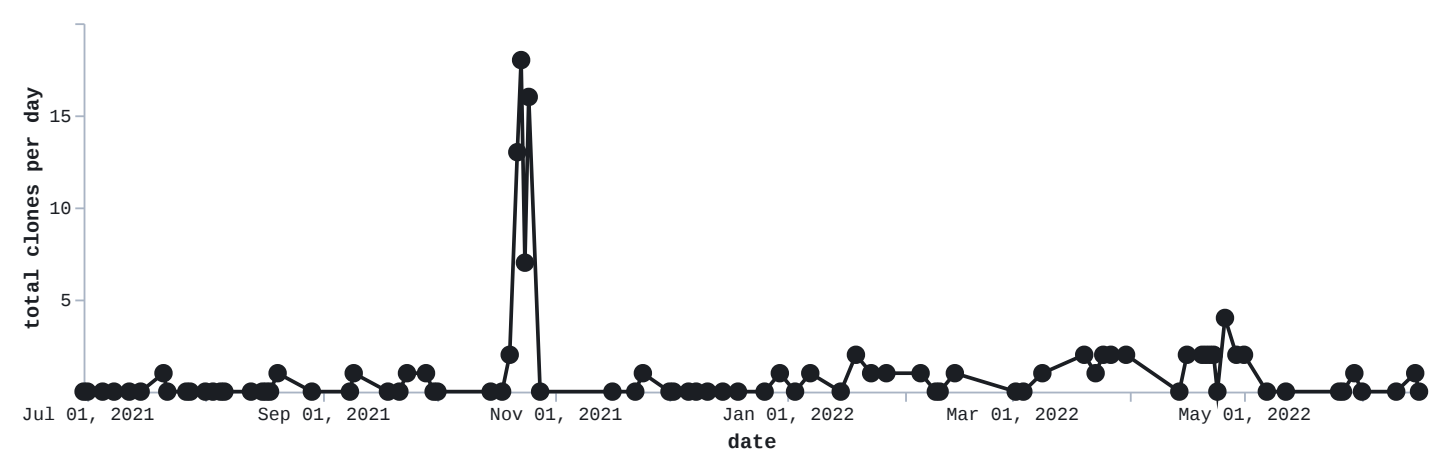

# Clones

Unique cloners

Total clones

# Stargazers

---

Each data point corresponds to at least one stargazer event. The time resolution is one day.

# Forks

---

Each data point corresponds to at least one fork event. The time resolution is one day.

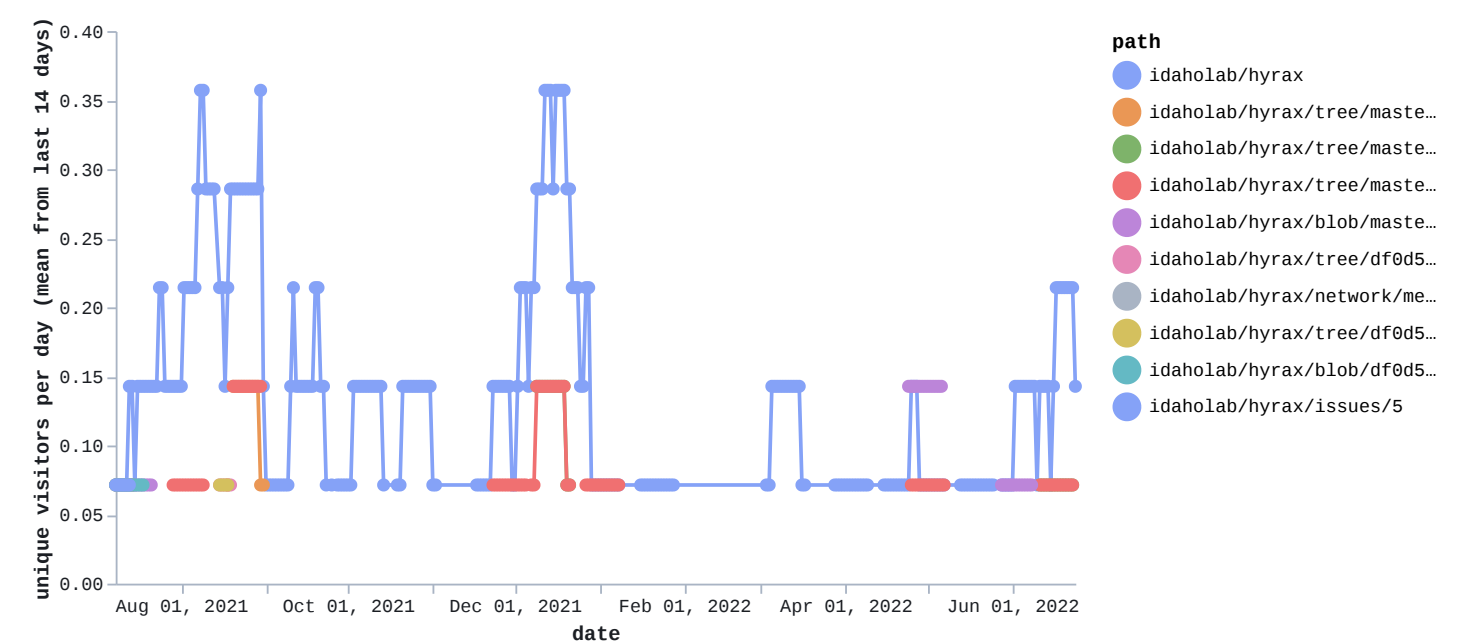

Note: Each data point in the plots shown below is influenced by the 14 days leading up to it. Each data point is the arithmetic mean of the “unique visitors per day” metric, built from a time window of 14 days width, and plotted at the right edge of that very time window. That is, these plots respond slowly to change (narrow peaks are smoothed out).

The chart displays the mean number of unique visitors per day from the last 14 days for three referrers. The y-axis ranges from 0.00 to 0.24. The x-axis shows dates from August 2021 to June 2022. The 'referrer' legend indicates: github.com (blue), Google (orange), and m.baidu.com (green).

Key observations from the chart:

- github.com (blue):** Shows significant volatility in August 2021, with peaks reaching approximately 0.215. It then drops to a baseline of about 0.07 and remains relatively stable, with occasional spikes to 0.14 in late 2021 and early 2022.
- Google (orange):** Starts at a high of about 0.145 in August 2021, drops to the baseline by mid-August, and remains there with minor fluctuations, including a spike to 0.145 in May 2022.
- m.baidu.com (green):** Only appears as a data point at the baseline (0.07) in early August 2021 and is not visible for the remainder of the period.
