### Unique visitors

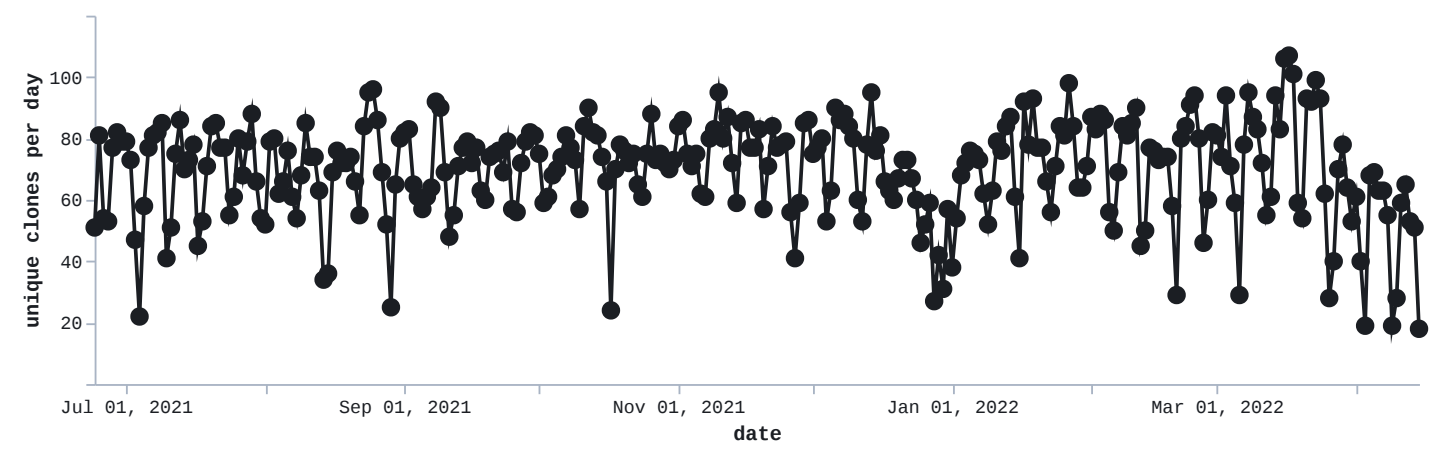

### Total views

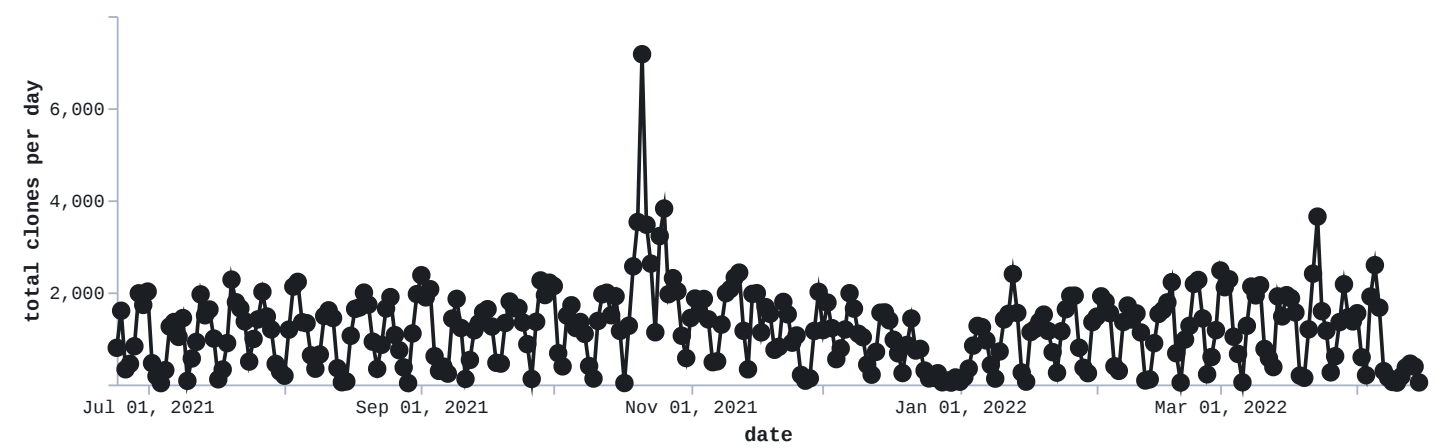

# Clones

## Unique cloners

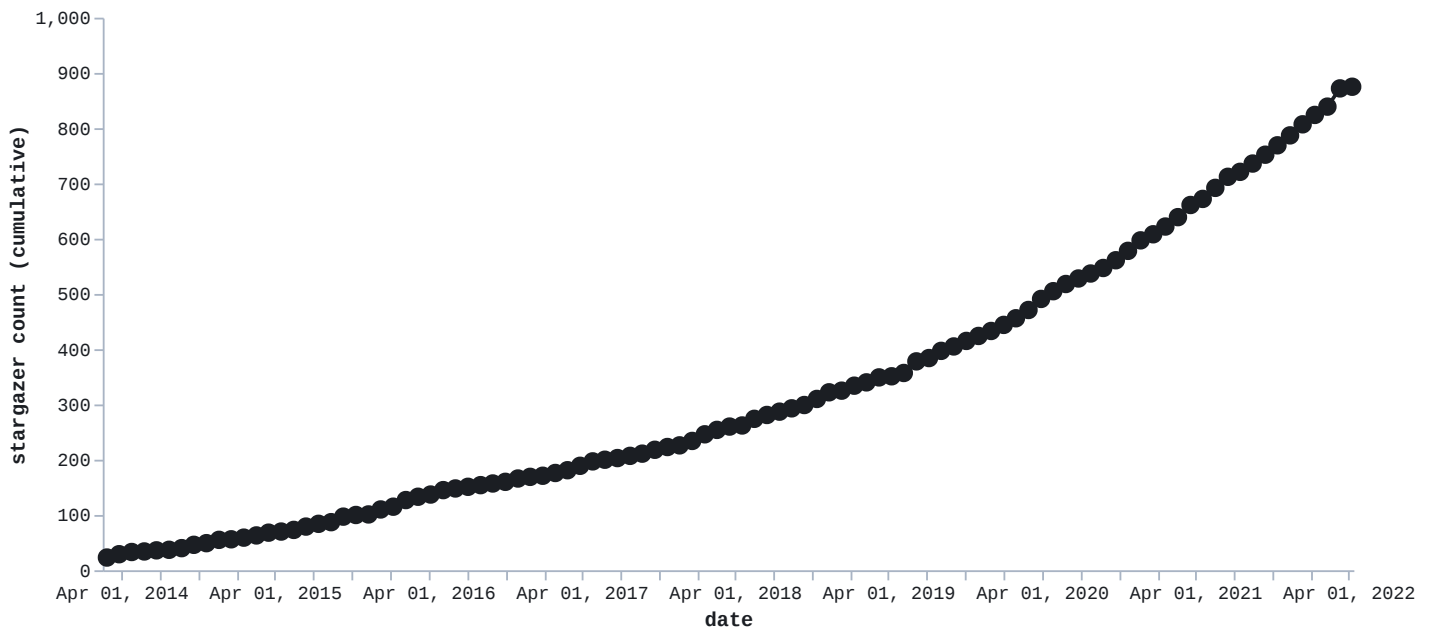

## Total clones

# Stargazers

---

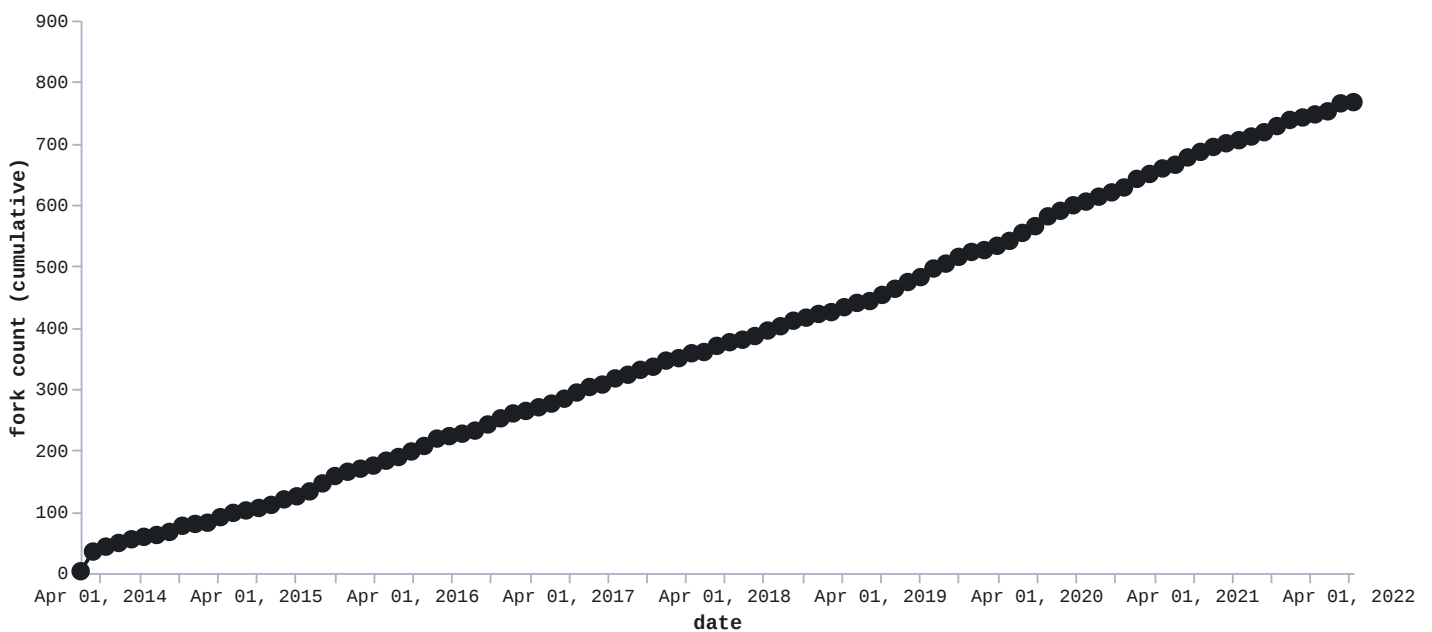

Each data point corresponds to at least one stargazer event. The time resolution is one day.

# Forks

---

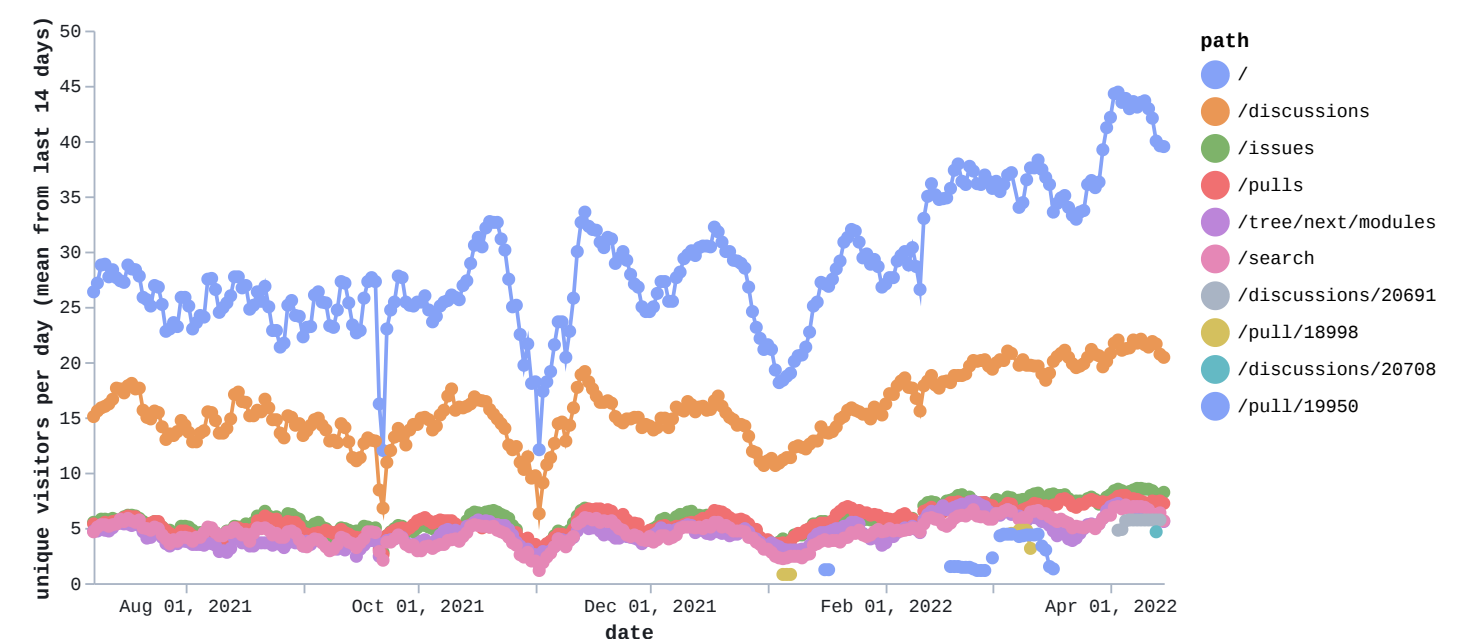

Each data point corresponds to at least one fork event. The time resolution is one day.

Note: Each data point in the plots shown below is influenced by the 14 days leading up to it. Each data point is the arithmetic mean of the “unique visitors per day” metric, built from a time window of 14 days width, and plotted at the right edge of that very time window. That is, these plots respond slowly to change (narrow peaks are smoothed out).

The chart displays the daily mean number of unique visitors from various referrers over a 14-day rolling period. The y-axis represents the number of unique visitors per day, ranging from 0 to 35. The x-axis represents the date, from August 1, 2021, to April 1, 2022. The legend identifies the referrers by color: Google (blue), github.com (orange), mooseframework.inl.gov (green), moose.inl.gov (red), groups.google.com (purple), cn.bing.com (pink), DuckDuckGo (grey), Bing (yellow), civet.inl.gov (teal), and com.google.android.gm (light blue). Google is the most significant referrer, showing a general upward trend with several peaks, reaching nearly 30 visitors per day by April. github.com and mooseframework.inl.gov also show significant traffic, with peaks around 22 and 21 respectively. The other referrers maintain very low, stable traffic levels throughout the period.
